**AMENDMENTS TO THE CLAIMS** 

This listing of claims replaces all prior versions of claims in the application.

**Listing of Claims** 

Claim 1 (Currently amended): A thermoacoustic apparatus comprising:

a loop tube;

a first stack sandwiched between a first high-temperature-side heat exchanger and a first

low-temperature-side heat exchanger, the first stack being provided in the loop tube; and

a second stack sandwiched between a second high-temperature-side heat exchanger and a

second low-temperature-side heat exchanger, the second stack being provided in the loop tube,

wherein a standing wave and a traveling wave are generated through self excitation by heating

the first high-temperature-side heat exchanger, so that the second low-temperature-side heat

exchanger is cooled by the standing wave and the traveling wave, or/and wherein a standing

wave and a traveling wave are generated through self excitation by cooling the first low-

temperature-side heat exchanger, so that the second high-temperature-side heat exchanger is

heated by the standing wave and the traveling wave.

wherein a support is disposed such that the loop tube is configured to include a plurality

of linear tube portions, which is vertical and in standing, and connection tube portions shorter

than the linear tube portions, and wherein the first stack is disposed in the longest linear tube

portion among the plurality of linear tube portions, wherein the second stack is disposed in one of

-2-

Amendment under 37 CFR §1.111

Application No. 10/594,278

Attorney Docket No. 063029

other linear tube portions than the first stack is disposed, wherein the second stack is disposed at

a level higher that the first stack.

Claim 2 (Original): The thermoacoustic apparatus according to Claim 1,

wherein when the lengths of the linear tube portion and the connection tube portion are

assumed to be La and Lb, respectively, La and Lb are set within the range satisfying

 $1:0.01 \le La:Lb < 1:1.$ 

Claim 3 (Original): The thermoacoustic apparatus according to Claim 1, in which a

standing wave and a traveling wave are generated through self excitation by heating the first

high-temperature-side heat exchanger, and the second low-temperature-side heat exchanger is

cooled by the standing wave and the traveling wave, wherein the first stack is disposed below the

center of the linear tube portion.

Claim 4 (Original): The thermoacoustic apparatus according to Claim 1, in which a

standing wave and a traveling wave are generated through self excitation by cooling the first low-

temperature-side heat exchanger, and the second high-temperature-side heat exchanger is heated

by the standing wave and the traveling wave, wherein the first stack is disposed above the center

of the linear tube portion.

Attorney Docket No. 063029

Claim 5 (Original): The thermoacoustic apparatus according to Claim 1, wherein when

one end of the linear tube portion is connected to one end of the connection tube portion, an

intersection of the respective center axes is assumed to be a start point of a circuit, and an entire

length of the circuit is assumed to be 1.00, the center of the first stack is set at a position

corresponding to  $0.28 \pm 0.05$  relative to the entire length of the circuit.

Claim 6 (Original): The thermoacoustic apparatus according to Claim 1, wherein when

an entire length of the circuit is assumed to be 1.00, a first peak of the pressure variation of a

working fluid along the circuit is present in the vicinity of the first stack, and a second peak is

present at a position corresponding to about one-half the entire length of the circuit, the second

stack is disposed in such a way that the center of the second stack is positioned past the second

peak.

Claim 7 (Original): The thermoacoustic apparatus according to Claim 1, wherein an

acoustic wave generator for generating the standing wave and the traveling wave is disposed on

the outer perimeter portion or in the inside of the loop tube.

Claim 8 (Original): The thermoacoustic apparatus according to Claim 1, wherein the first

stack or/and the second stack include connection channels arranged in such a way that the inner

diameters of individual connection channels are increased one after another as the position of the

connection channel approaches the outside.

Claim 9 (Original): The thermoacoustic apparatus according to Claim 1, wherein the first

- 4 -

Amendment under 37 CFR §1.111

Application No. 10/594,278

Attorney Docket No. 063029

stack or/and the second stack include connection channels arranged in such a way that the inner

diameters of individual connection channels are decreased one after another as the position of the

connection channel approaches the outside.

Claim 10 (Original): The thermoacoustic apparatus according to Claim 1, wherein the

first stack or/and the second stack include meandering connection channels.

Claim 11 (Original): The thermoacoustic apparatus according to Claim 1, wherein the

first stack or/and the second stack include connection channels arranged in such a way that the

flow path lengths of individual connection channels are decreased one after another as the

position of the connection channel approaches the outside.

Claim 12 (Original): The thermoacoustic apparatus according to Claim 1, wherein a

material for the first stack or/and the second stack is composed of at least one type of ceramic,

sintered metal, gauze, and nonwoven metal fabric, and the ωτ (ω: an angular frequency of the

working fluid, τ: temperature relaxation time) thereof is configured to become within the range

of 0.2 to 20.

Claim 13 (Previously presented): A thermoacoustic system comprising a plurality of

thermoacoustic apparatuses according to Claim 1, wherein a second low-temperature-side heat

exchanger in one thermoacoustic apparatus is connected to a first low-temperature-side heat

exchanger in another thermoacoustic apparatus adjacent thereto, or a second high-temperature-
